Hiring Team, AxisCare

I built PARCOVO, a production-grade SaaS platform for home care compliance while embedded inside a live agency. It handles Prior Authorization tracking, Medicaid documentation, and multi-tenant data isolation, HIPAA encrypted with live users. What the project clarified for me wasn't technical; it was a product philosophy. Authorization tracking already exists in most platforms, including AxisCare's. But tracking authorized hours isn't the same as surfacing compliance risk in real time. When a coordinator can see that authorized hours/units are expiring unused or that visit data isn't aligning with what was billed. That becomes a denied claim or an audit flag. I built PARCOVO around that principle, authorization as a compliance ledger, not just a number, and validated it with live users. That's the kind of thinking I'd bring to AxisCare's roadmap.

I noticed AxisCare launched Intelligence last November and that Axi, the AI chat assistant, is already embedded in the platform. That's a strong foundation, and it points to a product question I find genuinely interesting: when a system becomes the daily operating environment for agency staff, the interface itself becomes part of the compliance workflow. Axi already has a name and a presence. The question worth asking is what behaviors that character drives, whether coordinators trust it enough to act on its alerts, whether caregivers engage with the mobile app consistently enough to generate the data that makes intelligence useful. More engagement means better data. Better data means sharper insights. That feedback loop is a product problem as much as a technical one, and it's one I'd want to work on.

On how I work: I think through problems directly, ship early to get feedback fast, and push back when the data suggests we're deciding wrong, then execute fully once a decision is made. I'm fluent with AI tools (Claude, Cursor, rapid prototyping) to compress discovery cycles, but I don't let speed replace judgment on what matters to build. My best product decisions have come from sitting in the ops office watching where friction actually happens.

I'd be glad to walk through the PARCOVO architecture or talk through how I'd approach discovery at AxisCare. Thank you for your time.
